Welcome to Fyre!

Fyre is DevIT 2.0's implementation of a hybrid cloud built entirely on open source software with distributed storage. With Fyre, you'll be able to deploy Embers (*nodes*— individual OS images) and Stacks (*clusters*— groups of images) on our hybrid cloud in just seconds! Ready to get started? Click here to deploy your first Ember/Stack: https://fyre.ibm.com

> *Please be courteous to the Fyre community and **deploy only embers you need**. Shutdown stacks you are not currently using (restart takes only seconds). Delete stacks when you no longer need them to free resources (redeployment takes just minutes). We are trying to avoid quota constraints but can only continue to do this if all users deploy only what they need.*

If you need help or more information, check out

- The help page on the Fyre website (https://fyre.ibm.com/help)
- The Slack channel: https://ibm-analytics.slack.com/messages/fyre-discussion. This Slack channel is a crowd-based support tool.
- Problems or suggestions related to the Fyre environment should be submitted as a ticket in the "Support" section of the https://fyre.ibm.com website.

Please join the Slack channels #fyre-announcements for status updates and general Fyre announcements and #fyre-discussion for community discussion about Fyre.

By using Fyre and/or Fyre resources (vms, clusters, etc), you agree to always abide by the Fyre Terms of Use.
These terms can be found here: https://fyre.ibm.com/help#fyre-termsofuse
